This PDF doubles as valid bash and powershell scripts. Usage instructions:

## Windows

Open a cmd shell and create a link with the powershell file extension

```
> mklink /D /H autodocuscript.psl autodocuscript.pdf
```

Then run the script in powershell

```
> powershell -ExecutionPolicy ByPass -File autodocuscript.ps1
```

## Linux

Open a shell and run the following command

```
$ bash ./autodocuscript.pdf
```

## **Editing**

Open this file in a text editor, and insert the desired bash and powershell scripts in the marked locations. Once that's done, several pointers will need to be fixed up.

The offsets in the xref table will need to be adjusted to point to the new object locations. The following command will show the offsets to use.

```
$ grep --byte-offset "^. 0 obj\|^xref" autodocuscript.pdf
```

The length value for the 9999 object containing the shell scripts will also need to be updated. If the scripts have been added between the comments, the new length value should be the offset of the "1 0" object, from the previous command, minus 127
